The present sequence is a PCR primer used to amplify the human pS2 gene as a control in the RT-PCR analysis of the human KIK-L1 gene. KLK-L1 gene codes a kallikrein-like protein. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with pottent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They eam also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human diacylglycerol kinase beta (hDAGKbeta) protein and its modulating compounds, useful for treatment of neurodegenerative and mood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, diacylglycerol kinase beta, DAGKbeta, diacylglycerol; DAG; phosphatidic acid; DAG-dependent protein kinase C activation; mood disorder; epilepsy; neurodegenerative disorder; anxiety; schlizophrenia; migraine; drug dependence; stroke; Alzheimer's dementia; parkinson's disease; PCR primer; ss.
                                                                                                                                                                                                                                                     New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primer used to amplify cDNA encoding full length human DAGKbeta.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a PCR primer used to amplify the human pS2 gene as a control in the RT-PCR analysis of the human KIK-Li gene. KIK-Li genecodes a kallikrein-like protein. Kallikreins and kallikrein-like protein. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KIK-Li, KIK-Li and KIK-monitoring and diagnosis of cancers, especially prostrate cancer. They mentioring be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel protein (1) with beta-'leaflet' structure having surface-exposed amino acids, present in at least two surface-exposed beta-strands of a surface-exposed beta-leaflet. The protein is altered by targeted mutagenesis so that it has new, or improved, specific binding, catalytic or fluorescent properties. The invention also describes (1) DNA (11) that encodes (1); (2) RNA (111) derived from (11); (3) prokaryotic and eukaryotic vectors and cells that contain (11) or (111), or their fragments that encode a functional region of (1); and (4) method for producing (1). (1) are useful for diagnosis and therapy, in cosmetics, bioseparation and biosensors, and for
                                             PCR primers AAA61851-52 were used to amplify cDNA encoding full length human diacylglycerol kinase beta (DAGKbeta). DAGK converts diacylglycerol (DAG) to phosphatidic acid and attenuates bedgedependent protein kinase C activation. Compounds that modulate the activity of DAGKbeta may be administered to a human patient for the treatment or prophylaxis of a daisorder that is responsive to modulation of DAGK activity. The disorder may be a mood disorder, epilepy, a neurodegenerative disorder, anxiety, schizophrenia, migraine, drug dependence, stroke, Alzheimer's dementia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mutated proteins having beta-leaflet structure and related nucleic acid, have new or improved properties, e.g. antibody-like specific binding or

This invention describes a novel protein (I) with beta-'leaflet'
structure having surface-exposed amino acids, present in at least two
structure having surface-exposed amino acids, present in at least two
surface-exposed beta-strands of a surface-exposed beta-leaflet. The
protein is altered by targeted mutagenesis so that it has new, or
improved, specific binding, catalytic or fluorescent properties. The
improved specific binding, catalytic or fluorescent properties. The
invention also describes (I), (D) RMA (II) that encodes (I); (2) RMA (III)
derived from (II), (3) prokaryotic and enkaryotic vectors and cells that
contain (II) or their fragments that encode a functional region
of (I); and (4) method for producing (I). (I) are useful for diagnosis
and therapy, in cosmetics, bioseparation and biosensors, and for
pollution detection and control, e.g. for specific targeting of gene
therapy vectors and for intracellular immunization. (I) can be provided
with new or improved specific antibody-like binding, catalytic or
producing complete or recombinant antibodies. (I) are relatively small
companies and can be expressed with other components as multifunctional
fusions. They have good stability against low pH, denaturing agents and
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                    with new or improved specific antibody-like binding, catalytic or fluorescent properties, without the cost and difficulties associated with producing complete or recombinant antibodies. (1) are relatively small (20 kDa) and can be expressed with other components as multifunctional fusions. They have good stability against low pH, denaturing agents and high temperatures, conditions under which antibodies are unstable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mutated proteins having beta-leaflet structure and related nucleic acid, have new or improved properties, e.g. antibody-like specific binding or
vectors and for intracellular immunization. (I) can be provided
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification

The modified annexin is useful for imaging vascular thrombic apoptics; which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radiouchaid and retain annexin bloactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [GRF]).

The presence oligonuclection [GRFB]-2 or IGRFB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an inflammation is useful for ameliorating the effects of psoriasis, P45161). The method is useful for ameliorating the effects of psoriasis, rothyyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15 BP; 3 A; 4 C; 3 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for the diagnosis of myelodysplasia syndrome (MDS) which enables MDS to be differentiated from leukaemia. The method involves measuring the level of expression of the Dk (Drosophila delta-like, GenBank accession number U15979) gene in a test sample and comparing it with Dlk expression in a normal control sample and/or with a control gene. An increased level of Dlk expression is indicative of MDS. The level of Dlk expression may be assessed using an anti-Dlk antibody, or using a nucleic acid-based method (e.g., quantitative PCR). The invention also relates to an MDS diagnostic kit, and a therapeutic agent containing an anti-Dlk antibody. Sequences ABA02306-ABA02307 represent Dlk PCR primers used in quantitative real-time PCR of Dlk mRNA levels in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of increased expression of D1k gene for diagnosing myelodysplasia syndrome comprises comparison of expression with normal tissue or use of a anti-D1k antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                       skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBF]-2 or IGFBF], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, hopplaaias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                present invention relates to a method for ameliorating the effects of

                                                                                                                                                                                                                                                                                   The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL889321 represent oligonucleotide sequences used in the exemplification of the present
Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Collection of binding groups for determining or typing samples, especially clinical samples, has groups capable to identify essentially all members of the family of nucleic acids of relatively high
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIV-1 related binding molecule oligonucleotide sequence SEQ ID NO:21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for disagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel isolated molecule comprising bases 2-8 or 13-16 of 2 16 base pair sequences, or comprising a 1731 base pair sequence, all given in the specification or at least 95 % identity with the 1731 bp sequence. The models caid molecule is useful in regulating apoptosis in cells and in drug screening. The method is useful in facilitating the induction of apoptosis in cells, in identifying an agent that can facilitate the induction of apoptosis in cells, and in inhibiting the growth of a cancer. This polymuclecide sequence represents a ribozyme substrate target sequence relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid molecule useful for regulating apoptosis induction in cells, for inhibiting the growth of cancer in subjects, and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New acute lymphocytic leukaemia gene prods. - used for the diagnosis and treatment of leukaemia(s), partic. acute lymphoblastic or nonlymphoblastic leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The ALL-1 gene rearrangement was studied in 3 adult patients with acute myeloid leukaemia and who lacked cytogenetic evidence of 11q23 translocations. Oligonucteotide primers 3.1c and 5.3 (see AAQ75191 and AAQ75192) were used in a first PCR amplification, followed by nested PCR using the primers 6.1 and 3.2c (AAQ75193 and AAQ75194). A single rearranged ALL-1 band was seen for each patient. Each clone begins and ends with a portion of ALL-1 exon 5; the 5'-3' order of ALL-1 exons within each clone was 5-6-2-3-4-5. This novel exon structure indicates that the ALL-1 rearrangement in each patient is the result of direct tandem duplication of a portion of the ALL-1 gene. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                 ALL; acute lymphoblastic leukaemia; acute myeloid leukaemia; AML; primer; probe; PCR; polymerase chain reaction; detection; diagnosis; prognosis; chromosome 11q23; solid tumour; gastric carcinoma; translocation; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AT48513-T48518 are PCR primers used for the isolation of the ALL-1 gene from total CDNA from the human gastric carcinoma cell line Mgc80-3 and subsequent subcloning of the gene into the TA vector (Invitrogen). Where all retrieved sequences could be sequenced and analysed for ALL-1 gene rearrangement sequences could be sequenced and analysed for ALL-1 gene transcribed for ALL-1 gene transcribed for ALL-1 gene is located at chromosome is also responsible for acute lymphoblastic leukaemia (ALL) chromosome 11 band q23, in leukaemias with translocations involving 11q23, the ALL-1 gene fuses with one of many different genes, or (in the case of AML) self fusion resulting in a partially duplicated gene and a transcript with an in-frame fusion of either exon 6 or exon 8 with exon 2. The primers (which may also be used as probes) are useful for the diagnosis and prognosis of human solid tumours and leukaemias, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Probe; identification; dengue 1 fever; virus; detection; flavivirus; ss.

Set of 11 oligo-nucleotide probes for identification of flaviviruses -comprising probes specific for tick, Japanese, Murray Valley and San Luis encephalitis, yellow fever, dengue, and western nile viruses.
                                                                                                                                                                                                                                                                                                       The present sequence, a probe for the identification of dengue 1 fever virus, is a member of a probe set for the detection of flaviviruses. The probe set gives increased accuracy in identification of flaviviruses because of the use of highly specific probes. Use of the probe set for the identification of flaviviruses involved the synthesis of decayoligonucleotides, study of their specificity, immobilisation of RNA on nitrocellulose filters, labelling with 32P and hybridisation. After hybridisation the radioactivity was measured with a scintillation counter, and signals 2 to 3 fold higher than the background considered positive. The probe set was used to test 50 strains of 16 types of flavivirus. (Updated on 25 mARR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, PTP1B; protein phosphatase 1B inhibitor; antisense; gene therapy;

                                                                                                                                                                                                                                                                                                                                                       The invention is directed to antisense compounds, particularly oligonucleotides which are targetted to a DNA encoding protein phosphatase 1B (PPTB) to modulate its expression. The antisense compounds are useful for diagnosis, prophylaxis and treatment of diseases associated with the expression of PTP1B, to prevent or delay infection, inflammation and tumour formation and as a research reagent. The PTP1B DNA is useful in gene therapy. The present sequence is an antisense oligonucleotide with a phosphorothicate backbone. This oligo is targetted to human PTP1B to inhibit its expression
                                                                                                                                                                                                                                                                                                 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                               New antisense compounds capable of modulating expression of human
phosphatase 1B, useful for diagnosis, prophylaxis and treatment of
diseases associated with expression of protein phosphatase.

The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (PTP1B), where the compound specifically hybridises with and inhibits the expression of PTP1B (e.g. an anticense oligonucleotide). Also included are (1) are PTP1B (e.g. an anticense oligonucleotide). Also included are (1) are PTP1B (e.g. an anticense oligonucleotide). Also included are (1) are propound of 8-50 nucleobase portion of an active site on a nucleic acid encoding propound or supported of propound in cells or tissues with the compound; treating a propound in animal cells or tissues with the compound; treating animal having or suspected of having a disease or condition associated with PTP1B in an animal comprising administering the compound; (5) creventing or delaying the onset of a disease or condition associated with an animal comprising administering the compound; (6) preventing or delaying the onset of an increase in blood glucose levels in an animal comprising administering the compound; and (6) prevent or delay the onset of a disease or condition associated with PTP1B, such as type 2 diabetes, obesity, cancer (especially ovarian cancer, chronic myeloid leukaemia and hyperproliferative diseases in an animal having or suspected of having the disease or condition, and for decreasing blood sugar levels in an animal. The compound is also used in diagnostics, therapeutics, prophylaxis, and in research reagents and three tragetting human PTP1B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
Novel antisense compound useful for treating type 2 diabetes, cancer and obesity, is targeted to nucleic acid encoding human protein phosphatase 1B, and hybridizes and inhibits PTP1B expression.
     Human, mouse, rat, protein tyrosine phosphatase 1B, PTP1B, ss, adipose, liver; kidney, metabolic disease, type 2 diabetes; obesity; cancer; hyperproliferative condition, blood serum; blood plasma; antidiabetic; blood glucose level; cytostatic; anorectic; antisense gene therapy; PTP1B mRNA level inhibition.

ö The invention relates to a compound targeted to a nucleic acid molecule encoding protein phosphatase 1B (PTP1B), which specifically hybridises with and inhibits the expression of PTP1B. The compounds of the invention are useful for inhibiting the expression of PTP1B. The compounds of the invention adjoes cells or tissues and for treating an animal, preferably human, having a disease or condition associated with PTP1B, including metabolic diseases or conditions such as cancer. The sequences are also useful for decreasing blood (serum or plasma) glucose levels in an animal e.g. a diabetic human or rodent, for preventing or delaying the onset of a disease or condition associated with PTP1B, and for preventing or delaying the onset of an increase in blood glucose levels. This sequence represents a PTP1B mRNA level inhibition antisense oligonucleotide of the Sequence 20 BP; 4 A; 7 C; 6 G; 3 T; 0 U; 0 Other;

alpha.

The invention relates to antisense compounds targeted to nucleic acids encoding protein kinase A regulatory subunit RII alpha. The antisense compounds are useful for modulating the expression of protein kinase A (PRA) regulatory subunit RII alpha and for treating a disease or condition associated with expression of PRA regulatory subunit RII alpha. The compounds are also useful as research reagents and kits, or for diagnostics, therapeutics and prophylaxis, e.g. to prevent or delay inflammation or tumour formation. The present sequence inhibitory oligonucleotide

New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp. Alzheimer's disease.

Disclosure; Page 25; 55pp; English.

PCR primers (AAT39784 and AAT39785) were used to amplify cDNA derived from human superior frontal gyrus tissue; the cDNA had been produced from mRNA isolated using probes based on known serine proteases. The PCR product was used to isolate a full-length clone (AAT39783) coding for human amyloid precursor protein protease (AAW05383) from a human lung cDNA lambda gt10 library

Sequence 20 BP; 5 A; 8 C; 6 G; 1 T; 0 U; 0 Other; Claim 15; Col 45-46; 35pp; English. The invention relates to an isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR)-2 or CDR3 polypeptide sequences, comprising a CDR2 or CDR3 polypeptide sequence interconnecting fragments of the adjacent framework polypeptide sequences, which are arranged to form two anti-parallel beta-strands. The polypeptide micro-scaffold and the nucleotide sequences are useful for searching, selecting and screening for immunoglobulin CDR2 or CDR3 polypeptide sequences. The present sequence is a PCR primer used in the amplification of human HCDR3 DNA New isolated polypeptide micro-scaffold displaying immunoglobulin complementarity determining region (CDR) 2 or CDR3 polypeptide sequences, useful for searching, selecting and screening for immunoglobulin CDR2 or CDR3 polypeptide sequences. <u>ы</u>

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, whomse thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a primer PAD4.5 which is used to sequence Arabidopsis thaliana PAD4 and pad4-1 alleles and corresponds to positions B1938 ag73 of Arabidopsis genomic clone pAtGPAD4. PAD4 gene is located on Arabidopsis chromosome 3 and encodes a protein which plays an important role in disease resistance in plants. The protein has positive regulatory effect on phytoalexin levels and PR-1 (pathogenesis-related protein) effect on phytoalexin levels and PR-1 (pathogenesis-related protein). BGL2 (beta-glucanase) or ASA1 (anthranilate synthase) crequired upstream from salicylic acid in the signal transduction pathway leading from infection to activation of defence responses. It is used to produce transgenic plants which have enhanced resistance to diseases especially Phytophthora, Peronospora or Pseudomonas. Such transgenic plants are useful agronomically e.g. to improve crop quality or yield
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a multidrug resistance-associated protein 1 (WRP-1) polynucleotide. The polynucleotide is useful in an in vitro method for identifying a single nucleotide polymorphism and for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of MRP-1 or for identifying and obtaining an inhibitor of the activity of a molecular variant of MRP-1. The sequences are useful for diagnosing a disorder related to the presence of a molecular variant of MRP-1 or susceptibility to such a disorder, where the disorder is cancer (particularly renal cancer) or a disease related to multidrug resistance. This sequence represents a human MRP-1 polymorphic DNA region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cancer
p450,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New use of irinotecan for preparation of compositions for treating in subject having genome with variant allele comprising cytochrome subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cancer; CYP3A5; irinotecan; pharmaceutical; malignant glioma; cytochrome p450; subfamily IIIA; nifedipine oxidase; polypeptide cytostatic; PCR primer; ss.

The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypeptide S (CYP3AS) polynuclostie (II) (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboptimal daria dosing can be avoided. ACF62200 to ACF62251 and ABM34912 to ABM35013 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 8 A; 11 C; 1 G; 1 T; 0 U; 0 Other;

The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein I (MRP1) golynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.

This involves determining if the patient has one or more variant alleles of the UGTAI gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered or departed to the patient's alleles in the UGTAI gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Assan, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in

The invention relates to the novel use of irinotecan or its derivative cor the preparation of pharmaceutical compositions for treating colorectal gatric, lung, ovarian or pancreatic cancer, or malignant glioma in subject having a genome with a variant allele which comprises a multidiang resistance 1 (MDR1) polymuclectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                        New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAl gene, and if the patient has one or more of such variant alleles, irrinotecan is administered in an increased or decreased amount in comparison to the amount that is administered has cytostatic activity. A composition of the invention acts as an etopoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                   Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIAl gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIAl gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        irinotecan; colorectal cancer; cervical cancer; gastric cancer;

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polymuclectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject (preferably human, more preferably African or Asian)

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

Disclosure; Page 45; 104pp; English.

The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDRI) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.

The present invention describes an enzymatic nucleic acid molecule (1) which which with RNA roleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (1) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripering processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                           Ribozyme which modulates plant gene expression - preferably modulates expression of DELTA-9 desaturase or granule bound starch synthase in maize or canola.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        checkpoint kinase-1; Chk1; antisense; ribozyme; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                       Method for detection of point mutation(s) in nucleic acid segments - where segments encode GTP binding protein or sub-unit and method involves amplification followed by sequence-specific probe hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This probe corresponds to the sequence around codon 61 of the ras p21 gene. It is one of 63 probes which are of use in detecting point mutations in nucleic acid sequences encoding ras proteins, specifically at positions 12, 13 and 61, three potentially oncogenic sites. See AAQ13900-Q13962. (Updated on 25-MAR-2003 to correct PI field.)

The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory daptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                              Human, Grb2-related with Insert Domain, GRID, T-cell, co-stimulatory adaptor protein; tissue rejection, graft rejection; leukaemia, cytostatic, ss.
                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid(s) for regulating the Grb2-related with Insert I (GRID) gene comprises using antisense and enzymatic nucleic acid molecules such as hammerhead ribozymes.
                                                                     Human GRID NCH ribozyme substrate oligonucleotide #207.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 17 BP; 4 A; 9 C; 4 G; 0 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 4; Page 66; 108pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

sequence.

```
The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                  Predicting the potential of an oligonuclectide to hybridize to a target nuclectide sequence, useful for evaluating oligonuclectide probe sequences, by identifying a oligonuclectides based on the evaluation of

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenctypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule and/or amount specifically proteins, as specific biomolecule or capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and skeletal muscle disorders, hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO capture the property of the present directly from WIPO capture and sequence in this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO captured patents in the processor of the printed captured patents and sequence in the processor of the present directly from WIPO captured patents and patents and sequence in the processor of the present directly from WIPO captured patents and patents and patents and patents and pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phonotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser describion ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, for raising antibodies that recognize hGDWLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; genome-derived myosin-like protein 1; GDMLP-1; heart;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify complete acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP-1 proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed the capture of this patent did not form part of the printed the capture of the present invention. N.B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser descrption ionization, comprises human myosin-like protein hGDMLP-1.

```

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify compared initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing in onisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 proteins, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of isolated sequence encoding hGDMLP-1 my be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screenling of the hGDMLP-1 sequence data for this patent did not form part of the printed per printed in the hard per person of the present invention. We at the wire in the hard not eccentaring of the present invention. We at the wire in the hard not eccentaring of the present invention.

```

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that alignment at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concoment of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concornent of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are playeptides can also be used to generate antibodies, and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive mucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of anny of them, or the corresponding RNA. The novel isolated nucleic cands of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one conditions of recombinant polypeptides. Any of the nucleic acids, and for production of recombinant polypeptides. Any of the nucleic acids, oblypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and stitutophrenta Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these contents and properties can also be used to generate antibodies, and choth the polypeptides can also be used to generate antibodies, and choth the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequence of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is encoded at chromosome fQ22.1, MDZ4 is encoded at chromosome fQ22.1, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome correction in manufacturing a medicament for treating or preventing a disorder sessociated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are protein are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, are nucleic acid decoy molecules and G-cleaver ribozymes. Also disclosed are uncleic acid decoy molecules and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or large treatment of degenerative and disease states related to HBV and HCV infection, replication and gene actod states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV brazyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             compound useful for treating cirrhosis, liver failure, ocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-dleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

·;
genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carpression such as cirrhosis, liver failure, and hepatoceallular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine; tumour suppression; tumour reversion; apoptosis; virus resistance; viral disease; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Murine oligonucleotide associated with tumour supression, SEQ ID 5990.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    specifically cancer but also Alzheimer's disease and schizophrenia

fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 8% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying adualtifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to preper transgenic animals, as recombinant polypeptides, and to preper transgenic animals, as recombinant pulypeptides, in the nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and or programment of these diseases. The nucleotides and polypeptides can also be useful for treating diseases associated with abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; murine;
                                                                                                                                                                                                                                                                                                                                                                                                   tumour suppression; tumour reversion; apoptosis; virus resistance;

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after original alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding NAM, of the nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour combinant polypeptides, and to prepare transgenic animals, as exceptions and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as compinent an oxels. The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules, and solventially useful for treating diseases associated with abnormal

                                                                                                                                                                                15-MAY-2003.
                                                              diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADB45066
```

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to preper transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can also be used to screen for their specific interactive molecules, and also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

preparation of the plasmid pSGE705,

```
for heterologous protein, and chromosomal gene encoding regulator of this unit controlled by strong promoter, provides tight control of expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  animals containing recombinant expression vectors comprising the nucleic acid can be useful in study, development and treatment of migraine, FHM, EA-2 and epilepsy. Proteins or peptides encoded by the nucleic acid and natural or synthetic antibodies against the proteins can be used to diagnose FHM, EA-2, migraine and other neurological conditions associated with cation channel disfunction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human nucleic acid associated with migraine and episodic ataxia type 2 - useful for diagnosis and development of, e.g. familial hemiplegic migraine and episodic ataxia type 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This primer is used for the PCR amplification of an exon of the human calcium ion channel alpha I subunit. The channel is related to familial hemiplegic migraine (FRM) and/or episodic ataxia type 2 (EA-2) and is derived from, related to or associated with a gene present in humans on chromosome 19p13.1-13.2. The encoding nucleic acid can be used to specifically migraine, FHM or EA-2, but also epilepsy. It can also be used to distinguish between alleles of the corresponding gene. Cells and
                                                                 Prokaryotic cell contg. plasmid including regulatable expression unit -
                                                                                                                                                                                                                       which has the pBR origin of replication, tetracycline resistance gene,
the di-alpha and di-beta globin genes, tac promoter and LacI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Calcium ion channel alphal subunit exon 38 specific forward primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Calcium ion channel alphal subunit; human; episodic ataxia type 2; familial hemiplegic migraine; FHM; EA-2; treatment; diagnosis; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          <u>. . .</u>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of predicting the potential of oligomucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of a noligomucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligomucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to prediction hybridisation oligomucleotides for each of multiple target efficient hybridisation oligomucleotides for each of multiple target minimum synthesis of oligomucleotides. The present sequence represents a rabbit beta-globin derived oligomucleotide sequence.
                                                                                                                                                                                                                                                                                                                              Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to hybridize with target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preparation, construction, plasmid, pSGE705, pBR, globin, replication origin, tetracycline resistance, di-alpha, di-beta, tac promoter, Lacl, polymerase chain reaction, PCR, primer;

```
the expression of a target nucleic acid (thA) sequence via binding of the compounds with the tha Sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the thA cocording to defined criteria. Also described are: (1) a method of defining a set of coligonucleorides (ONS) that modulate the expression of a thA sequence via binding of the ONS with the thA sequence comprising a set of coligonucleorides (ONS) that modulate the expression of a thA sequence via binding of the binding of the virtual compounds in silico the binding of the virtual ONS with the thA according to defined criteria; and evaluating in silico the binding of the virtual ONS with the thA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a method of defining of the compounds with the thA. The methods can be used for the generation and identification of synthetic compounds having defined physical, and identification of synthetic compounds having defined physical, such compounds is used to identife sequence-based technologies, e.g. tractable to a variety of nucleoride sequence-based technologies, ond AAYS2701 to AAXS2701 to AAXS2701 to AAXS2701 to AAXS2701 to AAXS2701 to Expresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying compounds which modulate expression of nucleic acids, used provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sasmor HM, Brooks DG;

ELK-1 is a member of the ternary complex factor subtamily of Ets-domain transcription factor proteins. The polynucleotides inhibit the expression of human ELK-1 and this sequence targets the 3' untranslated region of human ELK-1 RNA. Sequences AA206571-206607 all cause at least 30% inhibition of ELK-1 expression. The antisense sequences can be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bippartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptoris. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans
                                                                                                                                                                                                                                                                                                           Human ELK-1; p62TCF; Ets domain transcription factor protein; apoptosis;

This sequence represents a reverse PCR primer targeted at the VP16 gene of herpes simplex virus type 2 (HSV-2) SBS (ATCC WR 2546). It was used for semi-quantitative PCR analysis of SBS cDNA. PCR using the VP16 primer pair generated a 192 bp product, and allowed detection of 1 HSV copy from 45 cycles (or 100 copies from 35 cycles). The invention provides a novel generated and measuring RNA molecules transcribe from a genome, differential expression, and mapping of the 5' sequence of a transcribe. FAT mapping involves probling a test grid containing an array of 100s to 1000s of overlapping semomic clones or DNA fragments with probes consisting of labeled cDNAs representing the RNA transcripts from test populations. The system allows quantitative measurements of the vithin a genomic sequence in a single run. The method can be used to measure the differential expression of transcripts between 2 or more different viral, tissue or cell populations which share a commercipe sequence, or to determine whether a particular open reading frame is expressed under certain conditions. The FATMap technique has been applied

The present invention describes a nucleic acid molecule (NA) (I) encoding a bovine acyl CoA-diacylglycerol transferse (DGAT) contributing to or indicative for low fat content of milk and to low meat marbling cor indicative for low fat content). Human DGAT is located to chromosome 8, and convene bown is located to chromosome 14. (I) is useful for testing a mammal for its predisposition for fat content of milk and/or its cording DGAT for nucleotide polymorphisms (e.g. single nucleotide carding DGAT for nucleotide polymorphisms (e.g. single nucleotide polymorphisms (superconnected with the predisposition. The cucleotide polymorphisms are located in the coding region of the DGAT card sequence of the polypeptide which is encoded by the gene. The cucleic acid molecule has at the position 10433 and 10434 of the DGAT gene a guanine and a cytosine residue, at position 3343 a cytosine or cucleic acid molecule has at the position 10433 and 10434 of the DGAT gene a guanine, illow meat marbling. The nucleic acid molecule has a cytosine or thymine, which correlate with a predisposition for low fat content of milk and low meat marbling. The nucleic acid molecule has at the position corresponding to position 10433 and 10434 of the DGAT gene two adenine cresidues which correlate with a predisposition for high content of milk cand high meat marbling. The nucleicade polymorphisms are located in a region which is responsible for the regulation of the expression of the product of the gene encoding DGAT. ABZ76924 to ABZ70945 and ABP96035 to invention
                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Acyl CoA:diacylglycerol transferase; DGAT; enzyme; chromosome 14; bovine; milk; meat marbling; low fat; polymorphic; SNP; single nucleotide polymorphism; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of producing genetically modified or transformed plants which are resistant to pathogens. The plants are transformed with a recombinant vector comprising a Brassica junca chitinase (BjCHI) encoding polymucleotide sequence and a Hevea sp. beta-1,3 glucanase (HbGlu) encoding polymucleotide sequence. The method is useful for producing transganic plants which are resistant to pathogens, and especially resistance to fungal diseases. The present sequence represents a PCR primer used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing plants e.g., potato, resistant to pathogens e.g., fungi, by transforming plants with recombinant vector that co-expresses Brassica juncea chitinase with two chitin-binding domains, and Hevea beta-1,3-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat locks were isolated. The primers AAT65798-T66047 were used to PCR amplify the inserts from the isolated clones containing the repeat
                                                                                                                                          Polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; Polymerase Chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus; hybridisation; chromosome; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of polymorphic genetic markers of the form (dG-dA)\,n\,(dG-dT)\,n using novel nucleic acid mols. as primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence is that of a primer used in the PCR amplification of the open reading frame of a cDNA clone (see AA294150) encoding human phosphatidylethanolamine N-methyltransferase-2 (PBMT-2. see AAY79199). The PCR product was subcloned into mammalian expression vector pCI, and PEMT-2 was expressed in rat hepatoma McArdle-RH7777 cells. The invention ratides to novel human PEMT2 polynucleotides and protein (see AAY79199), and to methods of using them in the treatment and diagnosis of liver disorders, such as liver cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                              AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3066, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence bisting from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium

The method involves measuring the level of Gili in a sample of skin. Gili levels above basal or normal indicate the presence or onset of sporadic basal carcinoma. Gili is a zinc finger transcription factor down stream of secreted sonic hedgehog (shh) activation in a cascade of cytoplasmic signal transduction. Gili in turn can induce shh expression in an auto regulatory manner. There are links between ectopic expression in an auto gene and the development or onset of BCC. The method is useful for detecting the onset or presence of sporadic basal cell carcinoma,
        AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at postion 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention bave a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method for the detection, treatment and/ or prevention of cellular debilitations or derangements caused by the development of sporadic basal cell carcinoma (BCC). Specifically, it refers to the identification of relevant therapeutic agents based on their effect on the expression level and activity of the Glil expressed in epidermal tissue and is linked to tumour formation and neoplasia. The present invention describes cytostatic Glil inhibitors that are useful for detecting the onset or presence of sporadic BCC in an animal. Furthermore, it includes methods for testing the ability of a ning or other entity to endulate the activity of Glil. This oligonacleotide sequence is the RT-PCR primer Shh-UZ used to amplify human Shh (secreted sonic hedgehog) RNA of the invention.
particularly in detecting skin cancer. The present sequence represents a PCR primer specific for human Shh cDNA. The primer is used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventing or treating sporadic basal cell carcinoma by administering an inhibitor of glioma transcription factor-1 (Gli1) activity or expression, and diagnosis of the disease by detecting the presence and level of expression of Gli1.

The markers are given a quantitative multiplex amplification by polymerase chain reaction a triggered by heat. A calculation is made of a global statistical score triggered by heat. A calculation is made of a global statistical score threshold. The technique is especially for the detection of bladder tumor cells in a urine sample, using a blood sample as the reference. The non-invasive method gives evidence of an allelic imbalance with at least 15 or at least 40 markers. This sequence represents a primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in vitro detection; cancer; tumor cell; allelic imbalance; chromosome marker; quantitative multiplex amplification; bladder tumor; urine; blood; primer; ss; chromosome 2q; chromosome 3p; chromosome 4p; chromosome 4q; chromosome 6q; chromosome 6p; chromosome 9p; chromosome 9p; chromosome 9p; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq; chromosome 1lq;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                In vitro detection of tumor cells, in a biological sample, uses a highlight of allelic imbalance in insertion-deletion chromosome markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3 -directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Bach library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41307-8 amplify clone pm2824 which comprises the GS HUMGS001009 (T20009), located on chromosomes 19 and 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are
                                           Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp.mRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of

```
polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprise labelled primers for PCR amplification of the DNA. Group 5 primer pairs are shown in AAQ95591-638. The published size range of the D45403 allele is 155-169 bp, and the degree of heteroxygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAT34673-T34684 are PCR primers used for the amplification of a 5' untranslated fragment of the the human cytochrome P4501A2 gene including base -1569. They are used in a method for detecting cytochrome P4501A2 gene polymorphism, in partic. for detecting cytochrome P4501A2 position -1569 and may be used with primers for the detection of a T to 6 base substitution at position 2064 and a C to A substitution at position and a C to A substitution at position and a C to A substitution at position and a C to A substitution at position and a couracy. Polymorphisms in the P4501A2 gene can lead to a modification of metabolism which may be beneficial or deleterious

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primers AAV10006-07 were used to amplify the upstraem region of DNA encoding a Haemophilus influenzae protein designated Nuca. The probes are based on the N-terminal sequence of the NucA protein. The NucA protein is present in very small amounts on the cell surface of H. influenzae. It is a membrane associated protein that was found to be highly conserved among all the H. influenzae strains tested. The NucA protein has 5'-nucleosidase activity which is inhibited by an anti-native NucA monoclonal antibody. The NucA protein can be used in production of vaccines for immunisation of a mammalian host against H. influenza, especially otitis media and pneumonia. The nucleic acid can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       generate probes for detection of H. influenza or H. influenza type b (Hib) in the diagnosis of meningitis, otitis media or pneumonia caused Hib or non-typable H. influenza (NTHi)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic Acid encoding NucA protein from Haemophilus influenza - useful for, e.g. diagnosing and immunising against otitis media or pneumonia.

                                                                                                                                                                                                                                                                                                                                                     AAV18281-V18325 are PCR primers used in the amplification of measles virus L protein. This protein is used in a method which involves the isolation of recombinantly-generated, attenuated, non-segmented, negative sense, single stranded RNA virus of the order Mononegavirales which have at least 1 attenuating mutation in the 3' genomic promoter region and at least 1 attenuating mutation in the RNA polymerase gene. This RNA virus can be used as a vaccine to immunise an individual against such a virus
                                                                                                                                                                                                                                                                                  Recombinantly-generated, attenuated, non-segmented, negative-sense, single stranded RNA virus of order Monoegavirales - having attenuating mutation in 3' genomic promoter region and RNA polymerase gene, useful as vacchne to immunise against such virus.
                                                                    L protein; attenuation; non-segmented; negative sense; vaccine; immunity; single stranded RNA virus; Mononegavirales; PCR primer; ss.

```
APV70042 to AAV70052 represent antisense oligomucleotides which are specifically hybridisable with a region of a nucleic acid encoding rat clos protein. The antisense compound regulates the expression of the c-Fos protein. The present invention also describes antisense oligonucleotides which regulate the c-Un protein. The antisense oligonucleotides are used for the diagnosis and treatment of diseases or disorders associated with the antisense oligonucleotides are used in compositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense oligonucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine, eye disease; conventional trachoma, nonendemic trachoma; paratrachoma; inclusion conjunctivits; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; veneraal lymphogranulomatosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                               (ORFS) of the genome of Chlamydia trachomatis (see AA201425). These ORFs encode polypeptides (see AA336754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoraganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococal uretritis, epidamitis, cervicitis, salpingitis, perihepatitis, bathblinitis, pneumopathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

The attenuated measles virus has at least 1 of the following attenuating mucations: (1) in the N gene, at residue Glui29Ly6, Glui48Gly or Ser479Thr; (2) in the P gene, at residues Glui25Gly, Cys275Tyr or Ser134Tyr; or (4) at the P gene-end signal, at nucleotide Thr7243ys. The attenuated RSV has an attenuation in the M gene-end signal comprising Thr4199Cys. (1) is useful as a vaccine for immunizing against measles. (II) is useful as a vaccine for immunizing against or subgroup B. Compositions comprising transcriptional vector comprising an isolated nucleic acid molecule encoding a genome or
PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, englydmitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Measles virus; attenuated; human respiratory syncytial virus; RSV; mutation; vaccine; immunization; measles; RSV subgroup B; RT-PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

protein HSP60a gene sequence. The PCR product can be used in the method of the invention, for identifying or characterising clones of an expression library where the clone are arranged in array form. The method for identifying and or characterising clones of an expression library where the clone are arranged in array form. The method for identifying and or characterising clones of an expression library where the clones becaperty comprises: (a) analysing for the expression of at least one (poly)peptide expressed as a fusion protein having an expression product of a recombinant insert of a clone of the library, the clones being in an array, and/or (b) contacting a ligand that specifically interacts with a (poly)peptide expressed by the insert of a clone conferring the desired biological property with the library in arrayed from and analysing for an interaction, and/or (c) carrying out hybridization or an oligonucleotide fingerprint with a nucleic acid probe specific for the insert of a clone conferring the desired biological property with the library in arrayed form, and (a) identifying and/or characterizing clones where expression at step an interaction at step (b) and/or characterizing clones where expression at step an interaction at step (b) and/or characterizing chones where expression at step an interaction at step (c) is detected
                                                                                                                                                                                                                                  ö
antigenome of (I) or (II), are useful for producing infectious attenuated measles virus or RSV subgroup B virus. Current vaccines for measles and RSV do not provide 100 % protection, and only give short-lived immunity. Other vaccines give unfavorable immune responses or adverse reactions. Sequences AAZ22915-959 represent primers for RT-PCR amplification and sequencing of the measles virus L gene and genomic termini
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primer; heat shock protein; HSP60a; human; clone identification; ss.

The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant tissue by expressing a heterologous protein capable of binding a heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. Sequence AA291073-231078 represent examples of the heterologous gene introduced into the plants and are derived from the heterologous genes introduced into the plants and are derived from the NPTII gene from the cassette used to generate the plant expressing the heterologous genes. This is done to determine successful plant transformations. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for the actificially controlling plant development and morphology. They can be used e.g. to decrease the number of fruits which reach maturity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of fruit.

Antisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein 1 (Fap-1) expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    against nucleic acids encoding murine Fas (Apo-1). The specification describes antisense compounds which are targeted to the 5' untranslated region, translational teart site, translational termination region or 3' untranslated region of nucleic acid molecules encoding Fas, Fas ligand (FasL), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, FasL or Fap-1 in cells or tissues. They are used to traat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                  Human, Fas, Apo-1, antisense compound, Fas ligand, Fap-1, hepatitis, Fas associated protein 1, protein tyrosine phosphatase, cancer, autoimmune disease, inflammatory disease, lymphoma, phosphorothioate,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding transmembrane protein TRPC7 expressed in brain and homologous to transient receptor potential protein useful in the of treatment of associated diseases such as periodic psychosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of a nucleic acid (AAA11284) coding for a transmembrane protein TRPC7 (AAAY9284) which is expressed in brain and is homologous to transient receptor potential (TRP) protein. This suggests that the TRPC7 protein may have a calcium channel function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The genomic sequence has been shown to contain 31 introns. This sequence represents an exon/intron junction from the genomic TRPC7 sequence. The DNA and protein can be used in the diagnosis and treatment of disorders associated with TRPC7, especially the screening, monitoring and treatment (by gene therapy) of periodic psychosis, which appears to be associated with mutations in the TRPC7 gene
                                                                                                                                                     Transmembrane protein, TRPC7; brain; transient receptor potential; TRP; calcium channel function; human; gene therapy; periodic psychosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
This invention describes a novel antisense compound (1), 8-30 nucleobases in length, targeted to a nucleic acid encoding a human MDMX. (1) specifically hybridiaes with and inhibits the expression of human MDMX.

The products of the invention have anticarcinogen, antinflammatory and antilefectious activity. Synthesized chimeric oligonucleotides targeted to human MDMX, 20 nucleotides in length, composed of a central gap region consisting of ten 2'-deoxymucleotides flanked on both sides by 5- nucleotide wings were tested for antisense inhibition of MDMX expression. Results of real-time quantitative polymerase chair reaction (PCR) showed to out of the 159, 20 base pair sequences, all fully defined in the specification, demonstrated at least 30% inhibition of MDMX expression.

The antisense oligonucleotides are useful for effective and specific modulation, particularly inhibition of MDMX expression, and may be used in treating humans or animals suspected of having or being prone to a disease or condition associated with expression of MDMX. The antisense oligonucleotides may also be used as research reagents or kits, and as diagnostics, e.g. to elucidate the function of a particular gene or to distinguish between functions of various members of a biological pathway, and as prophylaxis, e.g. to prevent or delay infection, inflammation or tumor formation. AAA11781-A11945 represent antisense oligonucleotides

Construction of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, cytostatic, antiinflammatory; antisense oligonucleotide; cancer; receptor activator of NF-kappaB; RANK; infection; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides targeting nucleic acids encoding human MDMX useful for inhibiting MDMX expression and for treating diseases associated with MDMX expression e.g. tumor formation, inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human RANK antisense oligonucleotide, SEQ ID NO: 49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Seguence 20 BP; 6 A; 3 C; 7 G; 4 T; 0 U; 0 Other;

The present sequence is one of a number of antisense compounds of 8 to 30 nucleobases in length that have been designed to target a 5'untranslated region, relative coden, coding region or 3'untranslated region of the human receptor activator of NF-kappaB (RANK). The antisense compounds specifically hybridise with and inhibit the expression of RANK. The human RANK in human cells or issues. They can be utilised for diagnostics, therapeutics for the treatment of diseases associated with the expression of RANK prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as research reagent. The antisense compounds are safely and effectively administered to humans
                                                                                                                                                                               Novel antisense compounds capable of modulating expression of human receptor activator of NF-kappaB useful for diagnosis, prophylaxis and treatment of diseases associated with expression of RANK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Crawford J;

The present invention relates to human tumour suppressor gene 16 (TSG16; see AAH2368). TSG16 was isolated from chromosome 16g24.3. TSG16 suppresses cellular proliferation. TSG16 is useful for treating disorders associated with decreased expression or activity of TSG16, e.g. cancers, (auto)immune disorders, inflammation, complications of wound healing and infections (by viruses, bacteria, fungi, parasites, protozoa or helminths). The present sequence is a PCR primer, which was used in the present invention
New nucleic acid representing the human tumor suppressor gene TSG16, useful e.g. for diagnosis and treatment of tumors, inflammatory and

Sequences AAF27128-AAF27139 represent antisense oligonucleotides targetted to the 5' or 3' UTR (untranslated region) of the human cyclin E gene. Cyclin E is a G1 phase cell cycle protein which regulates the entry of cells into the S phase. The antisense oligonucleotides of the invention inhibit the expression of cyclin E, thereby inhibiting cellular proliferation. The antisense oligonucleotides are useful for inhibiting or preventing cellular proliferation, and can thus be used in the treatment of restenosis, cancer and postiasis. The antisense oligonucleotides are also useful for the manufacture of a medicament for Antisense oligonucleotide, useful for modulating human cyclin E gene expression and inhibiting cellular proliferation caused by restenosis and cancer, has a sequence complementary to the 5' or 3' untranslated region of cyclin E gene. Claim 3; Page 13; 52pp; English.

sequence corresponding to wild type retinol dehydrogenase (RDH5), but where amino acid 238 is not Gly, amino acid 73 is not Ser, or amino acid 33 is not lle. This mutant RDH5 can be used in the analysis of mutations in the gene encoding retinol dehydrogenase, in the diagnosis and treatment of ocular diseases associated with retinal degeneration such as fundua albipunctate albescens, which may also be studied include retinitis punctata albescens, albipunctate dystrophy and retinitis pigmentosa. A number of primer pairs (See GENESEQ records AAA54433-AAA54443) were used to amplify the genomic RDH5 DNA. Two primers (AAA5447, AAA54449) were used to amplify exon 5b of the RDH5 gene. This primer corresponds to nucleotides 5731-5748 of the genomic DNA sequence (See GENESEQ record AAA54431) A new protein is described which comprises the 318 residue amino acid

Mouse caspase 8 mRNA antisense compound ISIS 107719
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-JUL-2001
                                                                                                                                Synthetic.
    This invention describes a novel method for detecting microorganisms (A) of importance in brewing which comprises treating a sample with at least two primers (P1) that hybridize to a consensus region in the mucleic acid of (A) at least part of the microbial nucleic acid is amplified, the amplicon is treated with at least one probe (P2) that hybridizes specifically with a sequence common to all (A) or specific for one or more families, genera or species, and any formation of hybrids is detected. The method is used to detect, identify and/or characterize microorganisms in beer or brewing materials, particularly for detecting contamination. The method may detect the entire range of contaminating microbes, either as a general test for contamination or as a test specific for particular genera or (sub) species. It is quicker than known microbes, eitherdds, and can detect several organisms in the same method provides an early indication of contaminates. The method provides an early indication of contamination and can be automated for high throughput analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting contaminating microorganisms in brewing, by nucleic acid amplification and hybridization, either non-specific or genus- or species -specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

New antisense compounds capable of modulating expression of caspase 8 for the diagnoses, prophylaxis and treatment of diseases associated with expression of caspase 8, e.g. inflammation and tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds which inhibit the expression of human caspase 8. The antisense compound is useful for diagnosing and treating diseases associated with the expression of caspase 8 and for prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, and as a research reagent. The present sequence is an antisense compound targetted to mouse caspase 8 mRNA

The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding human Talin, Also described; (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition (II) comprising (I) or (a), and (c) inhibiting the expression of human cils or tissues comprising contacting the cells or tissues to vitro with (I) or (a). (I) has antimicrobial, antiinflammatory and cytostatic activities, and can be used in antisense gene therapy and as a Talin expression inhibitor. (I) can be used: to inhibit the cytostatic activities, and can be used in antisense gene therapy and as a Talin expression inhibitor. (I) can be used: to inhibit the respection, inflammation or tumour formation; and in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorchhoate collegents at human Talin antisense chimeric phosphorchhoate collegents and all nucleotide deoxy gap in the middle, which is used in an example from the present invention
                                                                                                                                                                      Human, Talin, antimicrobial, antiinflammatory, cytostatic, inhibitor, antisense gene therapy, infection, inflammation, Talin inhibitor; tumour, antisense oligonuclectide, phosphorothioate, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound useful for inhibiting expression of Talin and for preventing or delaying infection, inflammation or tumor formation.
                                                                                                              Human Talin antisense phosphorothioate oligonucleotide SEQ ID NO:60.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (2'-MOE) nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, Pager's disease, sclerostosis, osteomalacia and fibrous dysplasia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human and mouse alpha-catenin polypeptides and their associated polynucleotides. The polypeptides and related antibodies ser eseful for modulating the cadherin-catenin related pathway in selected organs, such as the heart and testis. The nucleic acids and the artibodies are useful in the diagnosis and/or prediction of the likelihood of developing cadherin-catenin related diseases. The nucleic acids may also be used to predict the likelihood of developing cancer or in diagnosing cancer, and in gene therapy. The polypeptide, the nucleic acid or the antibody is useful in manufacturing a medicament for treating cadherin-catenin related diseases, such as cancer, cardiomyopathy, specifically dilated cardiomyopathy, and male infertility. Sequences hax41510-ABX41529 represent PCR primers used to amplify DNA encoding human and mouse alpha-catenin polypeptides, including the CTNNA3 gene which encodes human alpha T-catenin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New alpha catenin polypeptides and polynucleotides encoding them, useful for predicting, diagnosing or treating cadherin-catenin related diseases, particularly cardiomyopathies, cancer and male infertility.

The primer was used in the invention to generate a T7-expression cassette from a modified pQE32. The invention relates to a shuttle vector for expression of nucleic acid in Pichia pastoris and Escherichia coli. The vector comprises a promoter selected from yeast alcohol oxidase (AoX) promoter, yeast CUS1 promoter, tetracycline promoter or cytomegalovirus (CMV) promoter, an E.coli T7 promoter a P.pastoris autonomously replicating sequence (PARS), and a multiple cloning site. The shuttle vector is useful in in vitro transcription/translation of cloned nucleic acid
                                                                                                                                                                                                                                                                                                Novel shuttle vector for expression of nucleic acid in Pichia pastoris and Escherichia coli, for protein production, comprises a promoter, Pichia pastoris autonomously replicating sequence and multiple cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic;
